

***Beyond the Neonatal Intensive Care Unit***  
*the stories, with early aEEGs, cranial ultrasounds, MR  
brain images and later videoclips to illustrate their  
outcomes*

*Edited by Linda S de Vries and Inge-Lot van Haastert,  
Department of Neonatology, Wilhelmina Children's Hospital,  
Utrecht, The Netherlands*

The question which is often asked in the NICU is “what will my baby be like when he/she is a child; will he/she walk and be able to attend mainstream school? ”

The aim of this video-atlas is to share the stories of 27 children with you. They were all admitted to our NICU and were monitored with aEEG, had

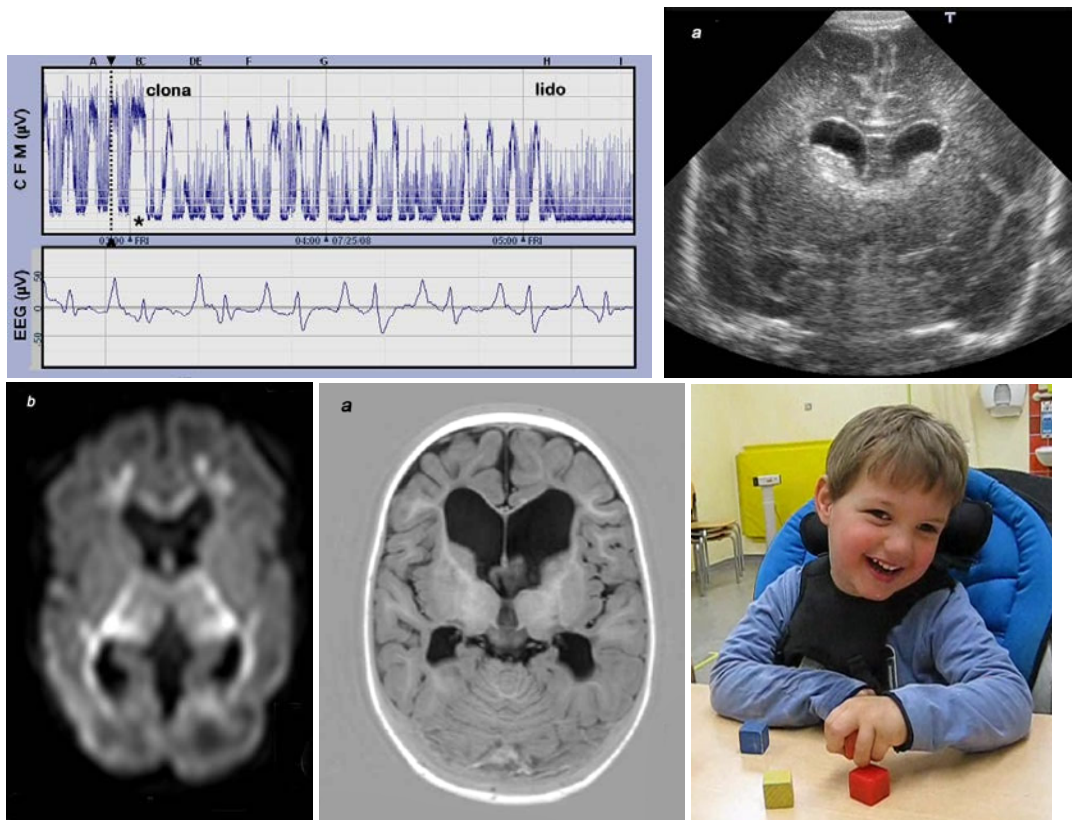

early and late Neuro-Imaging, both cranial ultrasound and neonatal MRI and often an MRI in infancy and childhood. They were seen in the follow-up clinic, most of them till at least 5 years of age. When they attended the follow-up clinic, short videoclips were made at almost every visit.

The book will include the story of children with

- a large GMH-IVH ( $n=4$ )
- c-PVL ( $n=7$ )
- perinatal stroke ( $n=8$ )
- HIE ( $n=8$ )

In 5 of them, an interview was done when they were adolescents or adults (14-22 years).

Linda S de Vries and  
Inge-Lot van Haastert
